Video – Update Disk

In order to make it easier to copy video-files to the Silverball terminal, there is a Video-Update-Disk which can be ordered under the number 831.000-029 at TAB Austria.

In your personal computer should be installed a mobile rack in order to enable copying video files to the Video-Update-Disk.

The PC mobile rack is also available at TAB Austria under the number 831.900-010 and should be installed by a computer specialist in your own personal computer as „secondary master“.

Optional to the Video-Update-Disk a USB 2.0 Dokingstation Update Kit is available. Order this part with partnumber 831 000 067. The condition for this part is a PC with a USB connection.

The video files (files with the ending .avi, .mpeg or .mpa) must be copied in the “mpeg” directory on the Video-Update Disk. As soon as the process is finished you have to shut down the personal computer and remove the Update-Disk.

Insert the disk into the switched-off Silverball terminal and turn on the terminal. The copy process starts automatically and is finished if the message “COPY PROCESS FINISHED” appears. Turn off the terminal and remove the Video-Update Disk. After the terminal is turned on again, the videos will be played in standby-mode.
